

# The Eagle Eye Light Flashing Bird Deterrent for Wide Area Bird Protection

From Pigeon Control Services cc 021 447 3578, pigeoncontrol@telkomsa.net

- An optical bird deterrent device recommended and approved by Cape Nature.
- The first bird scaring device to harmlessly re-locate birds successfully from unwanted areas such as buildings and structures
- Our Eagle Eye unit disorients the birds while in flight, with no harmful effect to the birds.
- Alleviation of bird infestation can take as little as three months, often much sooner.
- Protected range of more than 50 meters horizontally and up to 15 meters below the unit in the direction of the sun.
- The Eagle Eye is powered by 12 volts D.C. supplied by a supplied weather-proof mains transformer or by an optional solar panel.

## How does it work?

**The Eagle Eye is rotating a mirror which reflects very specific bands of sunlight into the pigeon's eyes as they fly near the area to be protected.** The birds find this very disturbing during flight and hence learn to avoid the area. The longer the system is in operation, the better it works.

Since you can only flash light in the approximate direction of the sun from a mirror you will need to keep this in mind when determining the mounting locations on your building. **Your goal is to ensure that sunlight is flashed continuously in the area to be protected throughout the daylight hours regardless of the sun's position in the sky.** This goal is what will determine the number of Eagle Eye units required and their correct placement for maximum effect. Ask for our free guide "Placement Guide for Pigeon Control" or for Cape Town area customers, we can arrange a site inspection and quote you on how many units are required and their correct placement on your building.
