Keep the birds away from your building

The Eagle Eye light flasher is an internationally patented effective bird deterrent device that harmlessly relocates birds. Birds are irritated by reflected light beams, including the ultraviolet and infrared bands that flash at various angles from a rotating Eagle Eye unit. The system has been extensively tested and used on hundreds of locations in South Africa as well as internationally.

Birds cannot become accustomed to the blinding and disorientating flashes of sunlight which is flashed into their eyes as they fly into the protected zone of the Eagle Eye. They learn to avoid the protected area.

The longer the system is in operation, the better it works.

Due to the movement of the sun across our northern sky during the day, a minimum of two units are required to ensure the zone to be protected is covered by flashes throughout the daylight period, regardless of the sun's position in the sky.

These units are designed to be powered by the wind. No electricity is needed. Wind driven units should not be used in areas that are renowned for high winds, as well as areas with no wind at all.

The wind-driven Eagle Eye should be used in conjunction with motorized units for best results.
